Suppose that you have three statements like this: String a, b, c; a = "My name is: "; b = "Your name is: "; c = "Okay, now my name is yours!"; If you want to use these statements separately, then you must get them first (e.g. by creating an array, storing all of them in it, and then retrieving the values as you need them). The problem is, this code does not seem very clean to me. To make the code more structured, I came up with the following: String a, b, c; if (a!= null) a = "My name is: "; if (b!= null) b = "Your name is: "; if (c!= null) c = "Okay, now my name is yours!"; Is there a cleaner way to do this? A: I would suggest making a single StringBuilder object and adding to it when you need to assign it to a particular variable. You might also consider making a class which has a constructor that takes in a string. This way, you could create a single instance and add to it:
