I need to create a Task that returns a Task. The most I can think of right now is this: `public Task SomeMethod() { // do something return Task.FromResult(1); }` This works, but it's not very elegant. Is there a better way to do this? A: The most obvious approach is to use `ContinueWith`: `return Task.Run(() => { // do something return 1; });` It isn't very clean though - you've effectively created an infinite loop. You can at least use `ConfigureAwait(false)` to get an empty Task that will be completed on the current thread. A: `a1d647c40b`

A technique for dose fractionation of isolated breast tumors in the mouse mammary gland. A technique has been developed for accurately delivering fractionated doses of single radiation beams to individual breast tumors in intact mice. The technique relies on the placement of a thermoplastic (polystyrene) cylinder with a screw thread around the rim of the tumor. A series of single beams, each of which is centered on the breast tumor, is then delivered at a specified separation. The shape of the dose distribution as a function of separation between the centers of the individual beams can be precisely defined using a simple computer model. This model is used to generate mathematical constraints for the delivery of the individual beams. The tolerance of the technique was investigated in an experiment in which the major diameter of each cylinder was calibrated by means of a gamma measurement. The cylinder technique was then used to deliver eight single-beam irradiations of either 1.5 or 2.0 Gy to eight breast tumors in intact mice. Dose distribution was determined using an optical camera and by measurement of the dimensions of a series of cylindrical volumes positioned at selected angles. The measurements were compared with model predictions. The tolerance of the technique was found to be +/- 1 mm, with a maximum error of less than +/- 2%. The precision of the technique was +/- 0.3 mm (1 sigma). The accuracy of the dose was +/- 0.3% in a volume of 1.7 x 0.9 x 0.4 mm. The tumor-to-normal-tissue dose ratios of the technique were within +/- 2% of the prescribed dose over a volume of 1.7 x 0.9 x 0.4 mm. The technique proved to be reproducible and versatile and was found to be sufficiently accurate to be used to deliver both single and multiple-beam irradiations to breast tumors in intact mice. The technique can also be used to deliver multiple-beam irradiations at extended intervals./
