KHs ONE [March-2022]

kHs ONE is an audio plugin that was developed in order to provide users with the means to perform high-fidelity sound processing through an array of oscillators and filters that are aimed at achieving an analog sounding output. Featuring a synthesizer interface that carries a module-based layout, it offers several sections, each holding different features. Provided that users have a VST host application, the plugin will provide functionality based on two main parts, corresponding to the voice and global components. Working on the voices prior to performing the global adjustments is the intended use here and two oscillators coupled with the amp envelopes and the filters constitute the basis for inputting and transforming the audio signal. The global component in particular features several on-board effects, such as chorus or delay and the dedicated master section allows users to perform equalizer adjustments or tweak the gain parameter for their sounds. The provided set of pre-defined banks offers users a wide range of 100 patches that can be applied and loaded to each different instance. Loading a patch will in consequence, automatically load the corresponding factory settings. Last but not least, other modules, such as the shaper will enable one to add certain distortions to the sound waveform, thus reaching the preferred outcome for the mixed audio content. Sure, it does a lot, but when the only option is to bypass the plugin entirely, what's the point? I'm not saying that you can't make a good plug-in, but the plugin's interface isn't as helpful as it could be, and it's not like it sounds good. What's New in the KHs ONE?

Multi-channel Metronome. LAGOM Multi-Channel. The thing that surprised us was the quality of sounds. So, we decided to check if the Multi-Channel, and especially this version, it was fully compatible with our new guitar that was custom-made, it has a volume regulation knob in the neck and a bridge of our choice. After several tries we played with different guitars. And the ones that had volume regulation knobs in the bridge played really well with the Multi-Channel because it is possible to turn on or off the each channel individually, thus allowing one to use those two knobs. As for the guitars, all of them sounded great. But the best was when the channel was turned on or off, the sound changes became more dramatic, especially on the guitar that has the bridge regulation knob. We think that the reason is simple: when a guitar is amplified, and we have the volume knob regulation on the bridge, we hear a sound, which is more expressive and with greater depth. Now, we are not sure if this is the case with the Multi-Channel and all guitar players, but we highly recommend it, especially for those who use electric guitars and want to be able to listen to their sound in the most natural way possible. As for the Multi-Channel, it is something really good and we are already planning to add some patches to it. We also hope that in the future it will have even more options. Description: Compatible with both Mac and Windows computer systems. Audio plug-ins for NCHOs. Multi-channel Metronome and Music. What we did in the NewHolland.com site we thought that it was worth adding a new section where we could focus on our products. After a while, we realized that it was not easy to find good virtual instruments for the Mac or Windows platforms. And therefore, we thought that it would be great if we could add in it a section for virtual instruments that we develop for the NCHOs platform. But the question was what would we offer to our visitors, and which instruments would we choose? To be honest, we had no clear idea of how this could be. We just decided that the instruments should offer plenty of features and that they should be mostly easy to use. Once we had those requirements in mind, we found that it was quite easy to find instruments that fit our needs. One of the most popular instruments for the Mac OS was a drum set that comes with many different drum kits that can be loaded and played from the app itself. We thought that the thing that we liked the most about this software was the ease of use and the fact that it comes with lots of different kits. It was after that that we realized that a virtual instrument would be even more advantageous because it could offer drum sounds that could be loaded and heard even before the drum kit is
